Fusion SecureDesktop

Secured VDI from the home

Transform your Windows computer for secure VDI access

Work locations are migrating from the traditional office, to people's homes in order that users may work in isolated and safe environments. The question is whether to buy new computers for home working or let them use their personal ones as is- the former is expensive, while the latter is unpredictable.

Fusion Secure Desktop provides a secure access environment to the company's VDI framework, using the user's personal computer or laptop running Windows 7 or Windows 10.

Fusion Secure Desktop is an add-on module that works with Fusion UEM, a highly featured enterprise management software that allows IT staff to manage and monitor endpoints powered by Windows, Android and iOS operating systems. Fusion Secure Desktop is very easy to install, just like any Windows application and is equally easily set up to connect, activate and configure with Fusion UEM.

Once installed, it provides the user with a desktop icon that launches a secured desktop environment within which the user is limited to access the applications and connections permitted by the IT department. Applications include connectors such as Citrix Receiver, VMware Horizon View and Microsoft RDS client, as well as custom applications like VPN or browser - all limited to the launch conditions pre-defined by the administrator. This level of control provides the company's management with peace of mind, knowing that the user cannot run any unauthorized applications that may pose a potential risk.

When the workday is done, the user simply logs out of the Secure Desktop and is immediately returned to their normal Windows desktop and applications.

Fusion Secure Desktop: Enabling secured homeworking at a very affordable price.
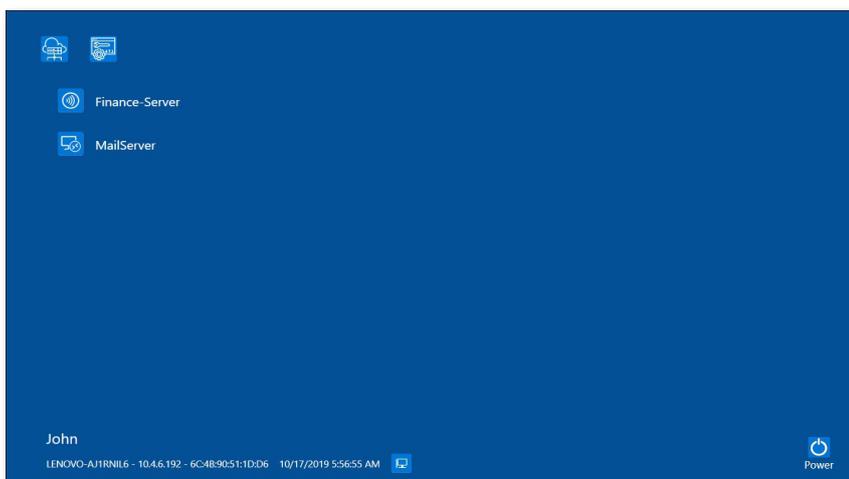

Secure and stable
SecureDesktop is designed to be installed on Windows and provide a secure environment for access to corporate VDI systems

Highly flexible
Configurable easily by the IT department to connect to almost any server framework: Citrix®, VMware® and Microsoft®, as well as custom applications.

Managed using Fusion UEM
SecureDesktop is a modular addon that is provided with a enterprise device license for Fusion UEM management and configuration.

FUSION SECUREDESKTOP IS BEST SUITED FOR

1 Businesses that want to move their office users into home working using their home PCs.

2 Want to deploy a secured environment for launching connections to corporate VDI.

3 Use a solution that is BYOD in nature - maintain the user's personal workspace.
